

# Welcome to the class

Why not only code it ?

# Famous Software Failures

- **AT&T long distance service fails for nine hours**  
(Wrong BREAK statement in C-Code, 1990)

# Why not only code it ?

## Famous Software Failures cont'd:

- **Mars Climate Orbiter (September 23<sup>rd</sup>, 1999)**

The 125 million dollar Mars Climate Orbiter is assumed lost by officials at NASA. The failure responsible for loss of the orbiter is attributed to a failure of NASA's system engineer process. The process did not specify the system of measurement to be used on the project. As a result, one of the development teams used Imperial measurement while the other used the metric system of measurement. When parameters from one module were passed to another during orbit navigation correct, no conversion was performed, resulting in the loss of the craft.

# Why not only code it ?

## Famous Software Failures cont'd:

- **Hi-tech toilet swallows woman (2001)**

[Source: Article by Lester Haines, 17 Apr 2001] A 51-year-old woman was subjected to a harrowing two-hour ordeal when she was imprisoned in a hi-tech public convenience. She was captured by the toilet, which boasts state-of-the-art electronic auto-flush and door sensors, which steadfastly refused to release it's victim, and further resisted attempts by passers-by to force the door. Finally the fire brigade ripped the roof off the cantankerous crapper.

# Why not only code it ?

## Famous Software Failures cont'd:

- **E-mail buffer overflow (1998)**

Several E-mail systems suffer from a "buffer overflow error", when extremely long e-mail addresses are received. The internal buffers receiving the addresses do not check for length and allow their buffers to overflow causing the applications to crash. Hostile hackers use this fault to trick the computer into running a malicious program in its place.

# Why not only code it ?

## Software is

- a critically important infrastructure component
- a key enabler
  - militarily
  - economically
  - scientifically
  - culturally

## But usually

- expensive
- of poor quality

# Common Software Problems

- **Software can cost hundreds or thousands of dollars per line**
- **Lifetime maintenance costs are higher still**
- **Software is late or fails**
- **Software is not performant (too slow)**
- **Software is incomprehensible**
- **Software is more trouble to use than it is worth**

# Past Approaches to Solutions

- Use more people
- Create better programming languages
- Write software tools to help create software
- Design before writing
  
- Start by baselining requirements
- Train people better

- Create more chaos
- Bad programs can be written in any language
- (who finds the error in reasoning in here ?)
- Are you designing the right program ?
- but they change !
  
- ...to do what ?

# The Software Crisis

## Summary:

**Millions are spent for an  
incomprehensible tool that comes  
late just to cause trouble, and we don't  
have answers**

**or:**

**THE SOFTWARE CRISIS**

**(1968)**

# History

## 1968: NATO Software Engineering Conference in Garmisch (Germany):

Why cannot bridge-building techniques be used to build operating systems (*'engineering'*) ?

# The Nature of Software

- It is a component of a larger system that “fits” with hardware, people, mechanical devices
- It transforms data using computers
- It has a complex structure
- It is usually very large, expensive, and lengthy to build

# The Nature of Software

- Software is extremely malleable – we can modify the product all too easily
- Software construction is human-intensive, there are no real costs of materials
- Software is intangible: no laws of physics are applicable
- Software is not detectable by any of the five human senses

# The Nature of Software

**But:**

**The are characteristics analogue to physical engineering processes**

**Studying such analogs can be useful:**

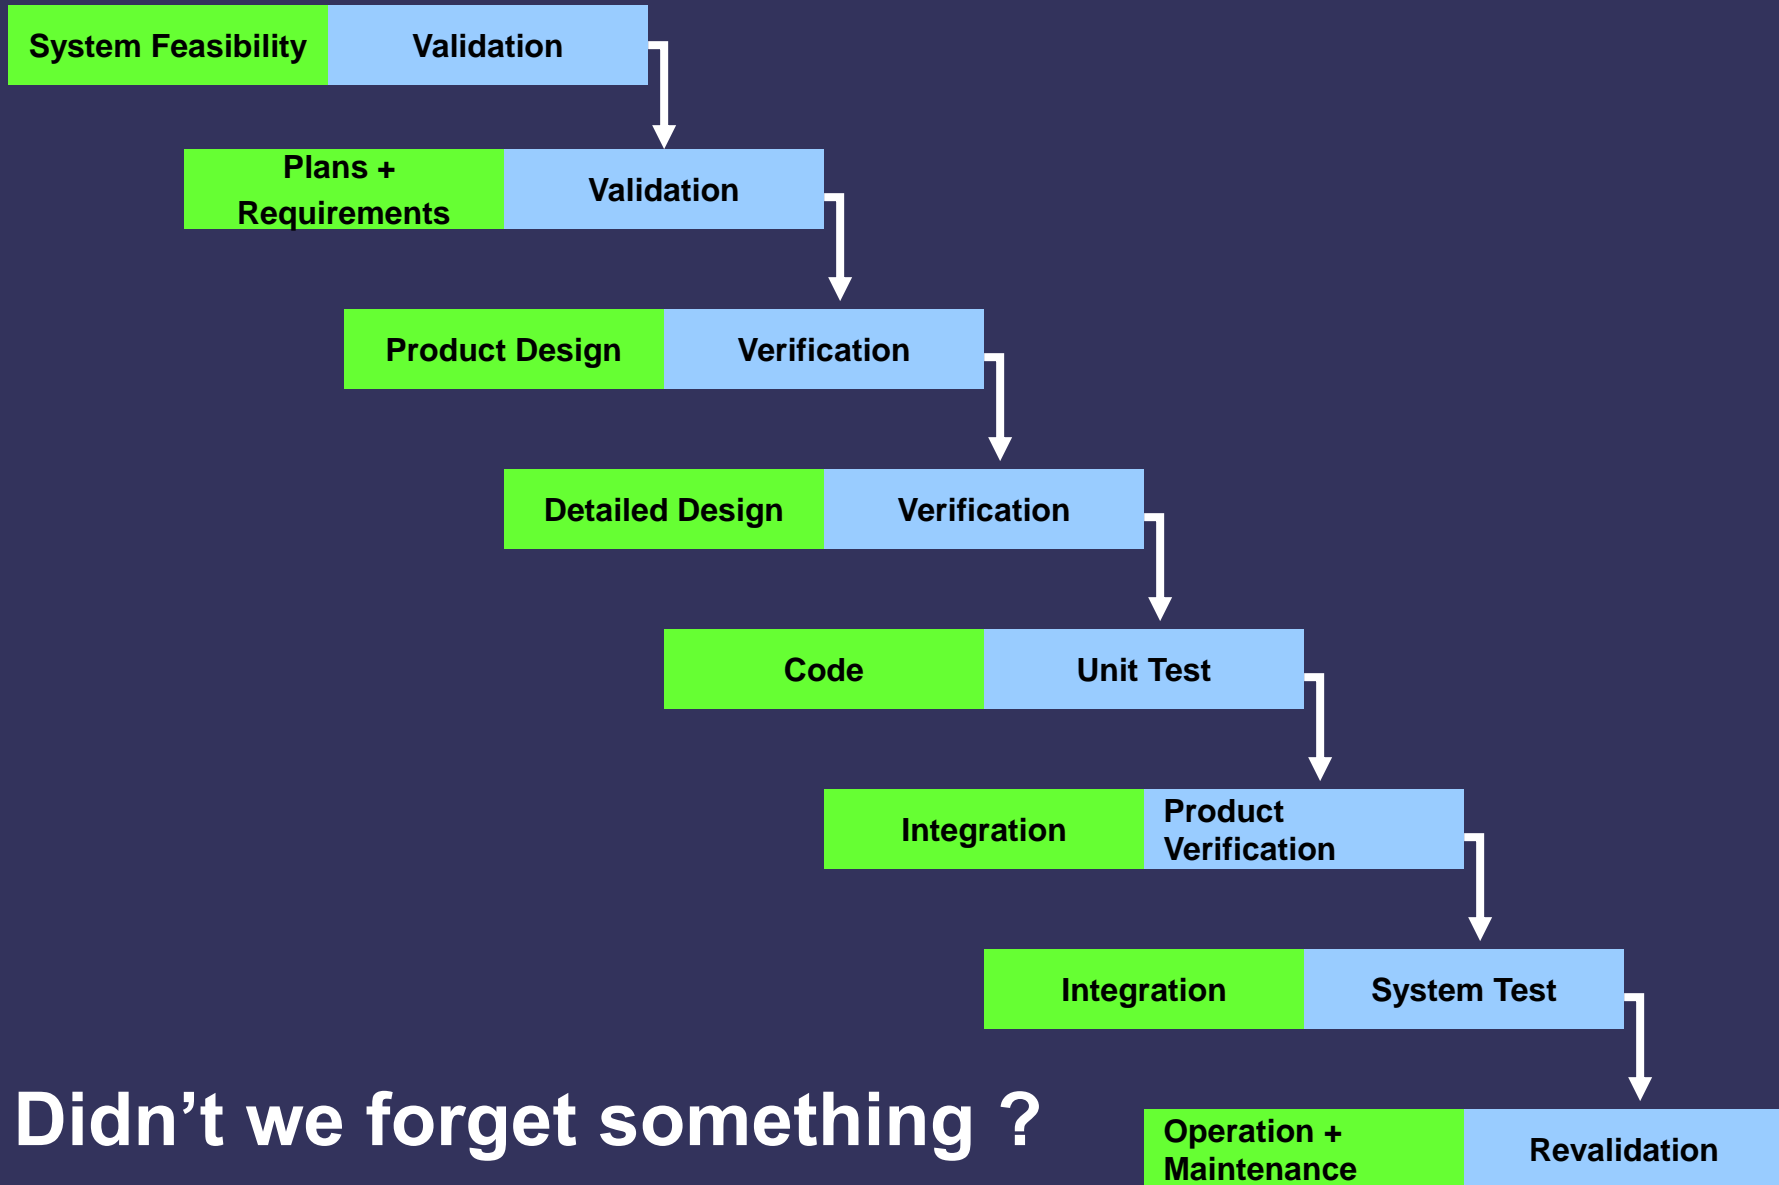

- **Help us learn about computer software**
- **Find points of similarity**
- **Suggest successful approaches to be emulated**
- **Avoid known mistakes**

# Engineering Example

## Building a house:

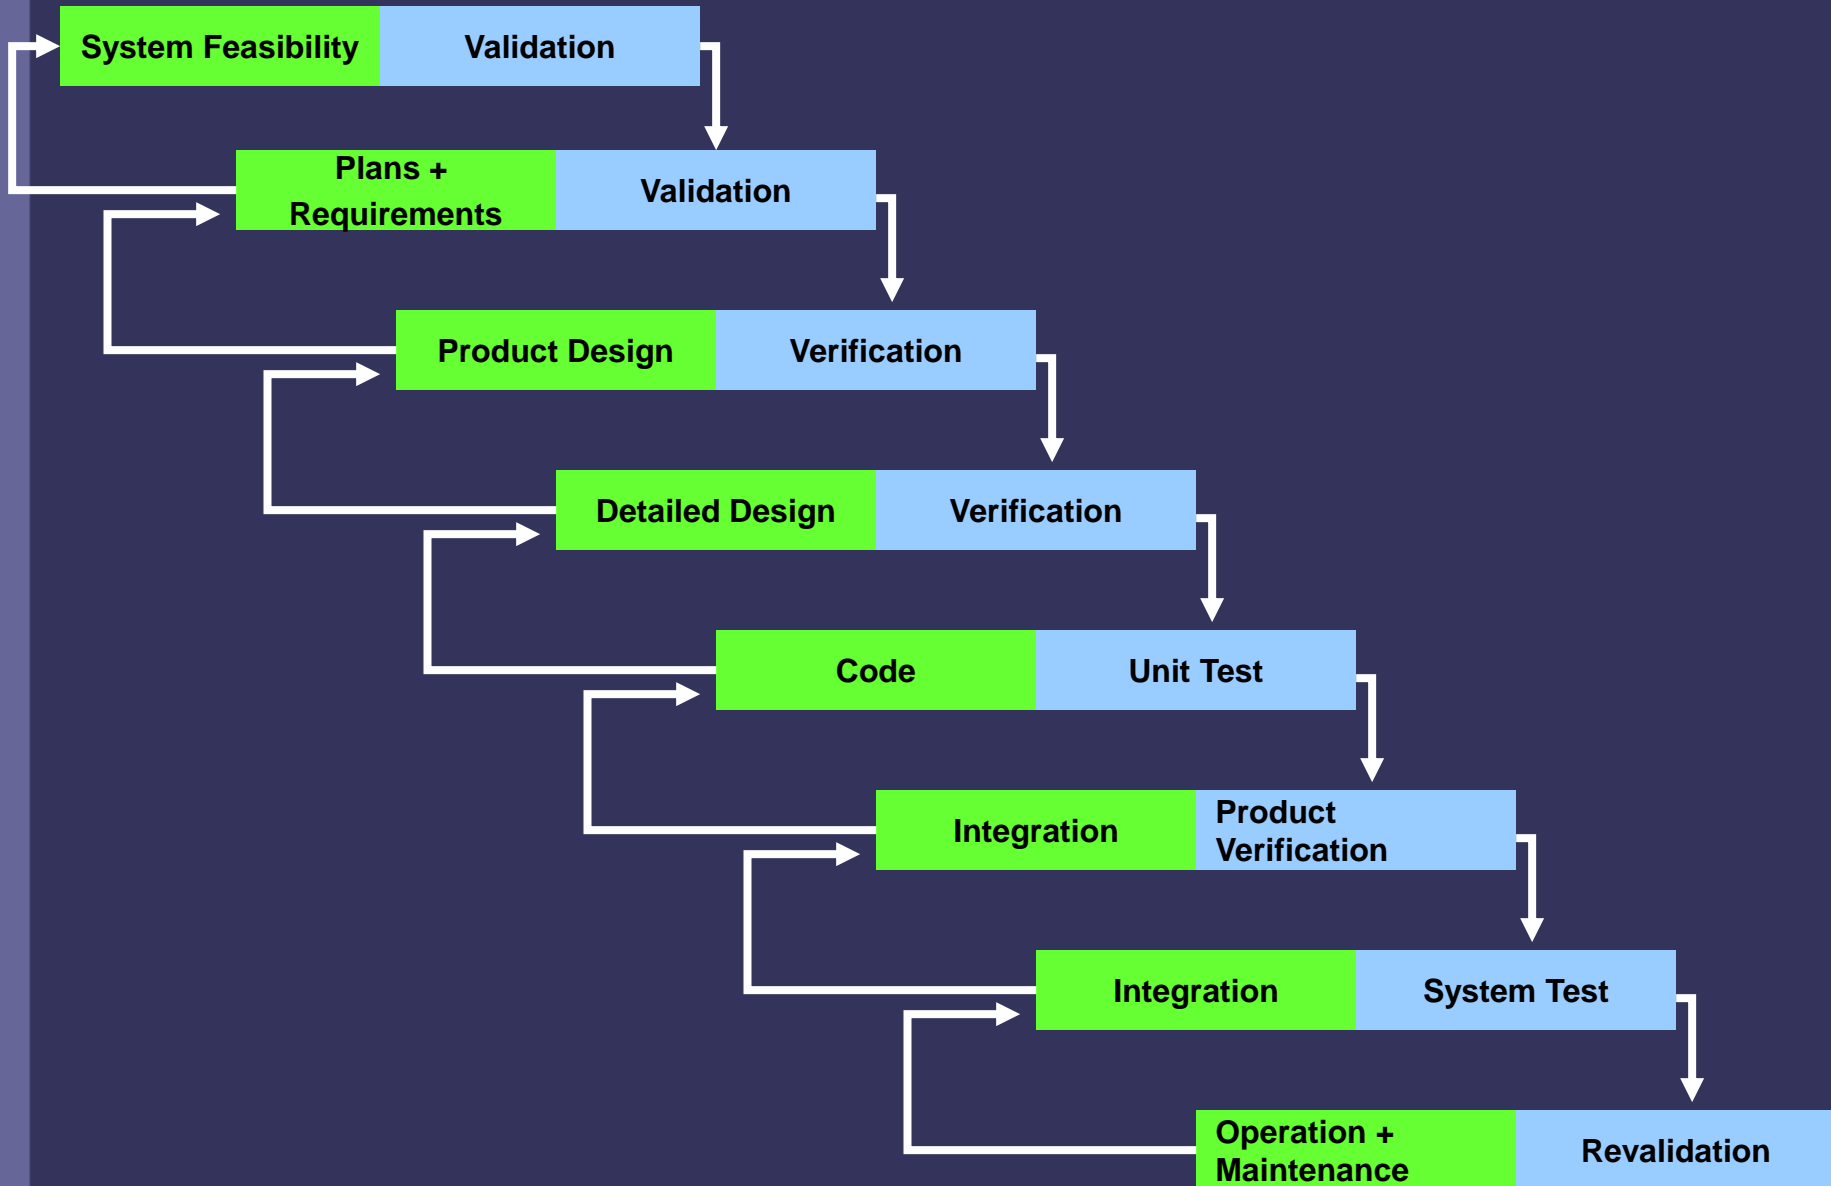

- **Land and finances** System Feasibility
- **Conceptual design** Software Plans and Requirements
- **Architect will define number of floors and rooms, overall structure** Product Design
- **Architect will define number of rooms, furniture, etc.** Detailed Design
- **Construction** Code
- **Entering** Integration (Product Verification)
- **Living in the house** Integration (System Test)
- **Fixing minor problems, leaking in the roof ...** Operations and Maintenance

# The Waterfall Model

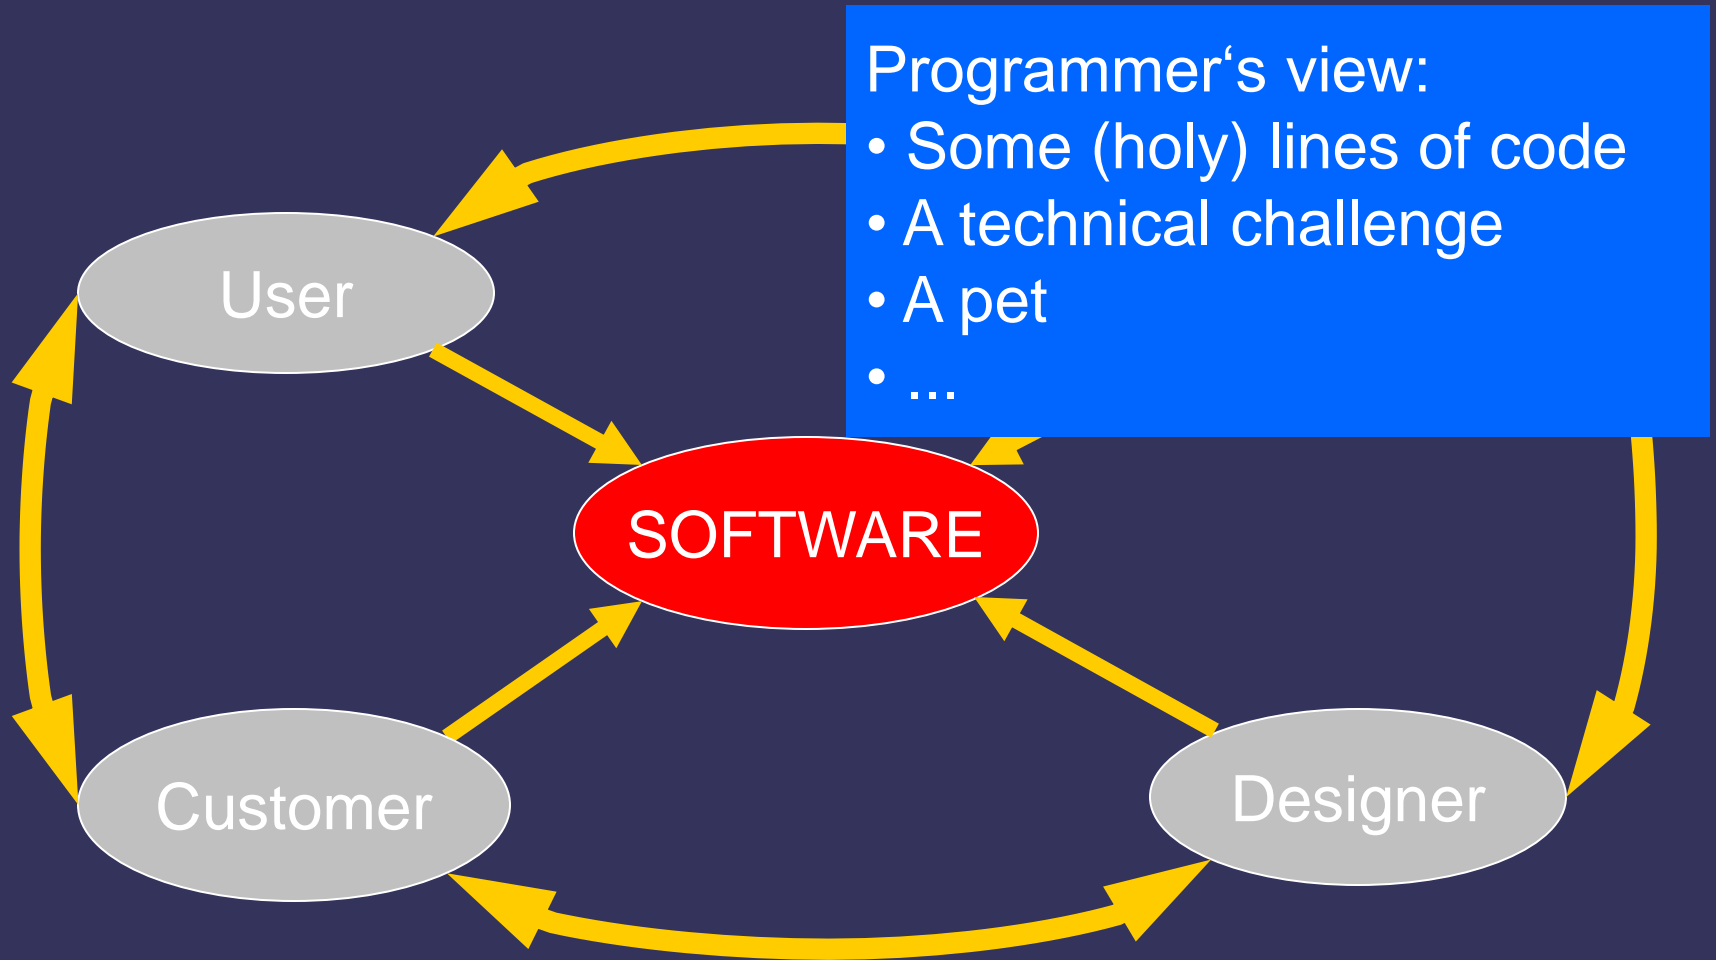

Didn't we forget something ?

# The Waterfall Model

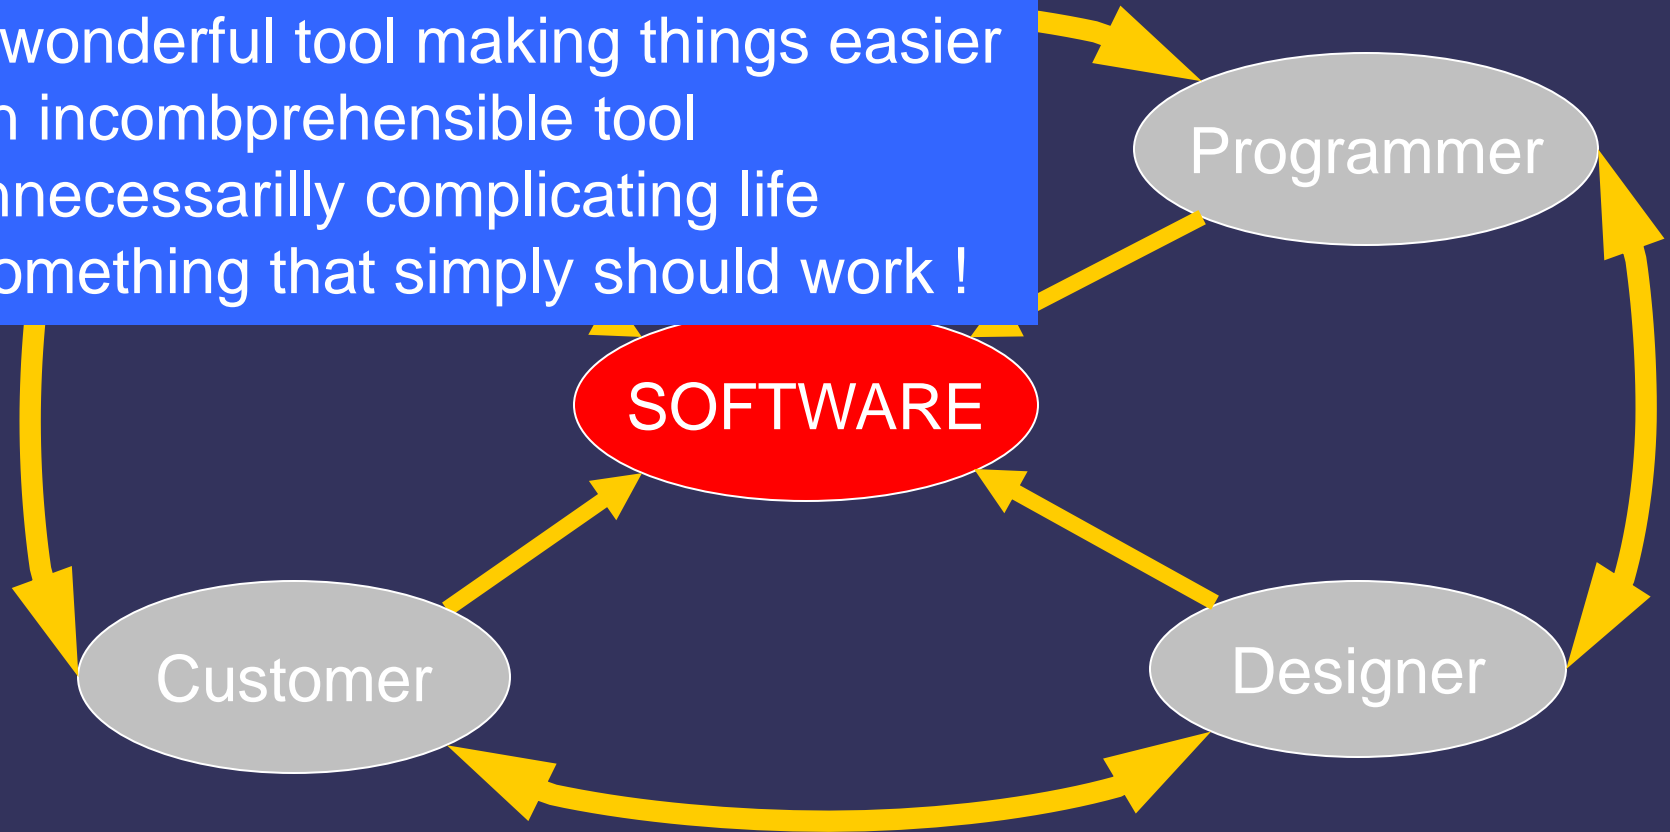

# The Human Factor

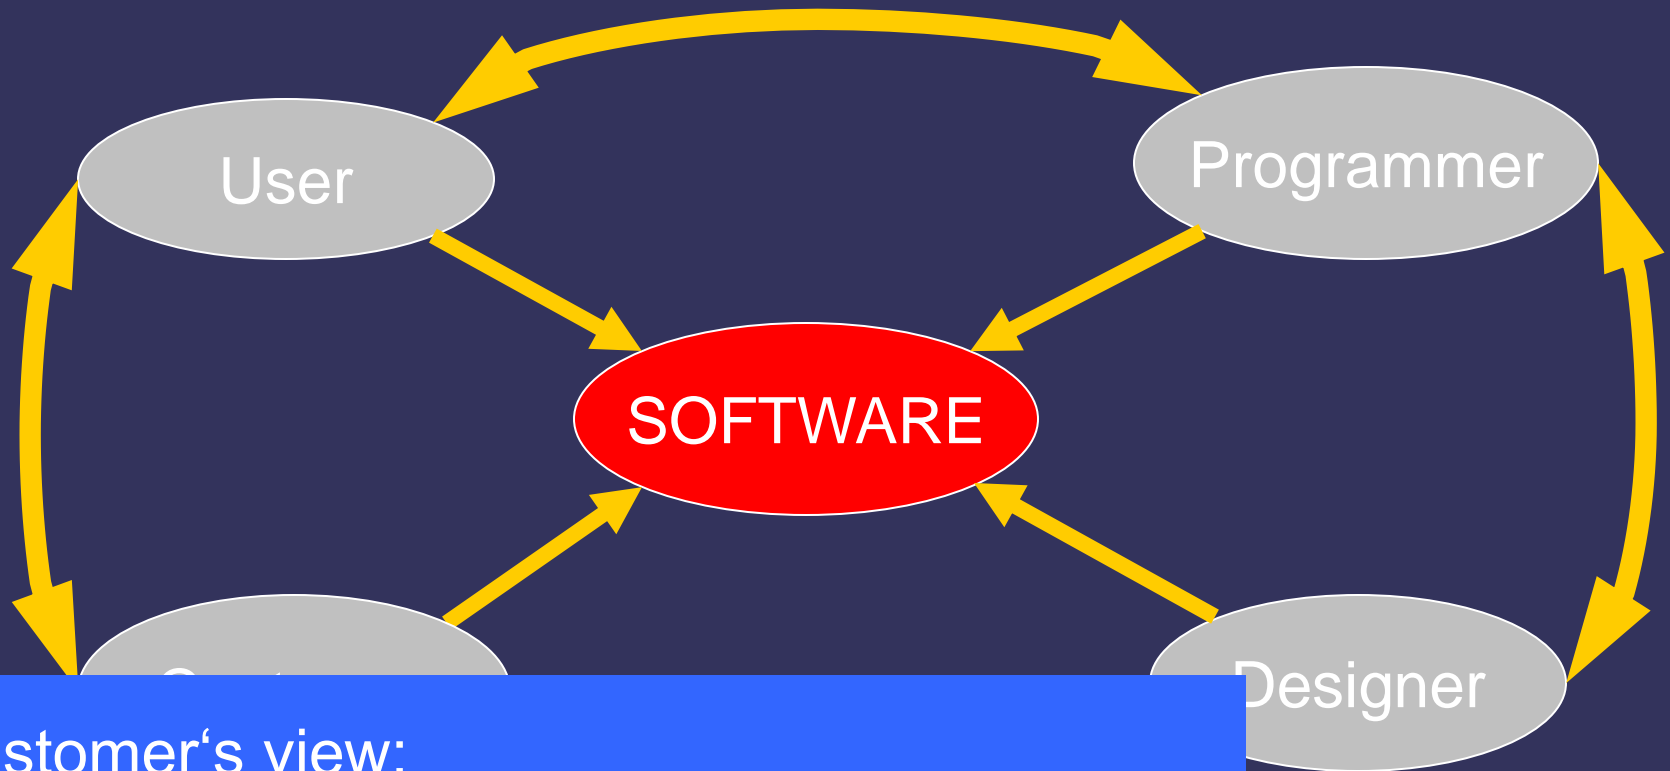

# The Human Factor

User's view:

- A miracle
- A wonderful tool making things easier
- An incomprehensible tool unnecessarily complicating life
- Something that simply should work !

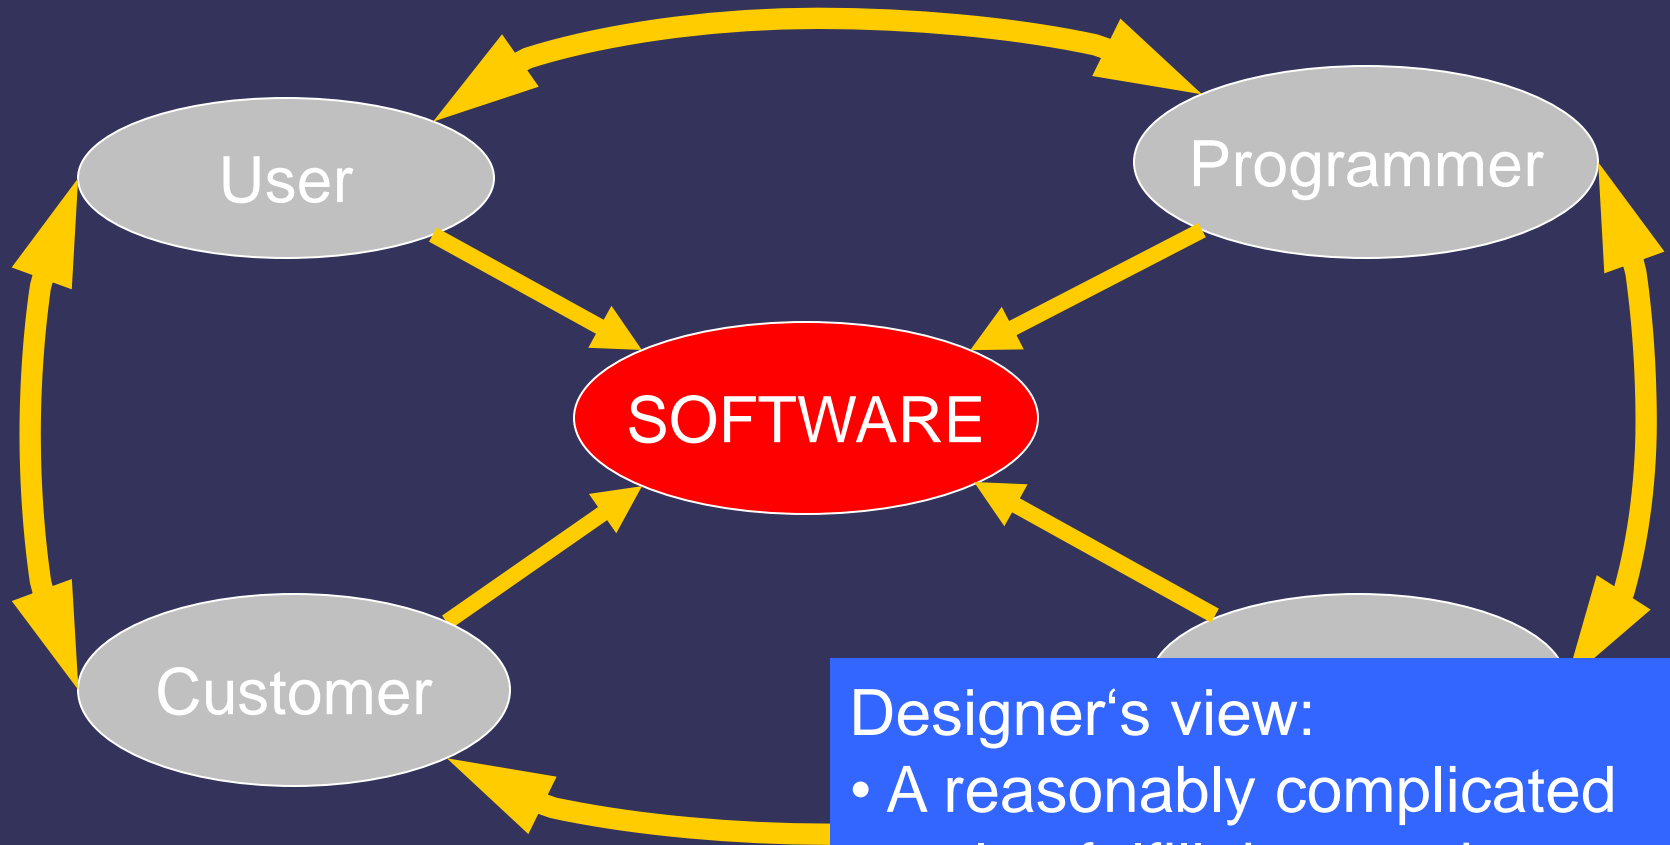

# The Human Factor

Customer's view:

- A hopefully affordable tool to enhance profit.

# The Human Factor

Designer's view:

- A reasonably complicated tool to fulfill the needs
- A technical challenge

# Review of Waterfall Model

## **Weaknesses:**

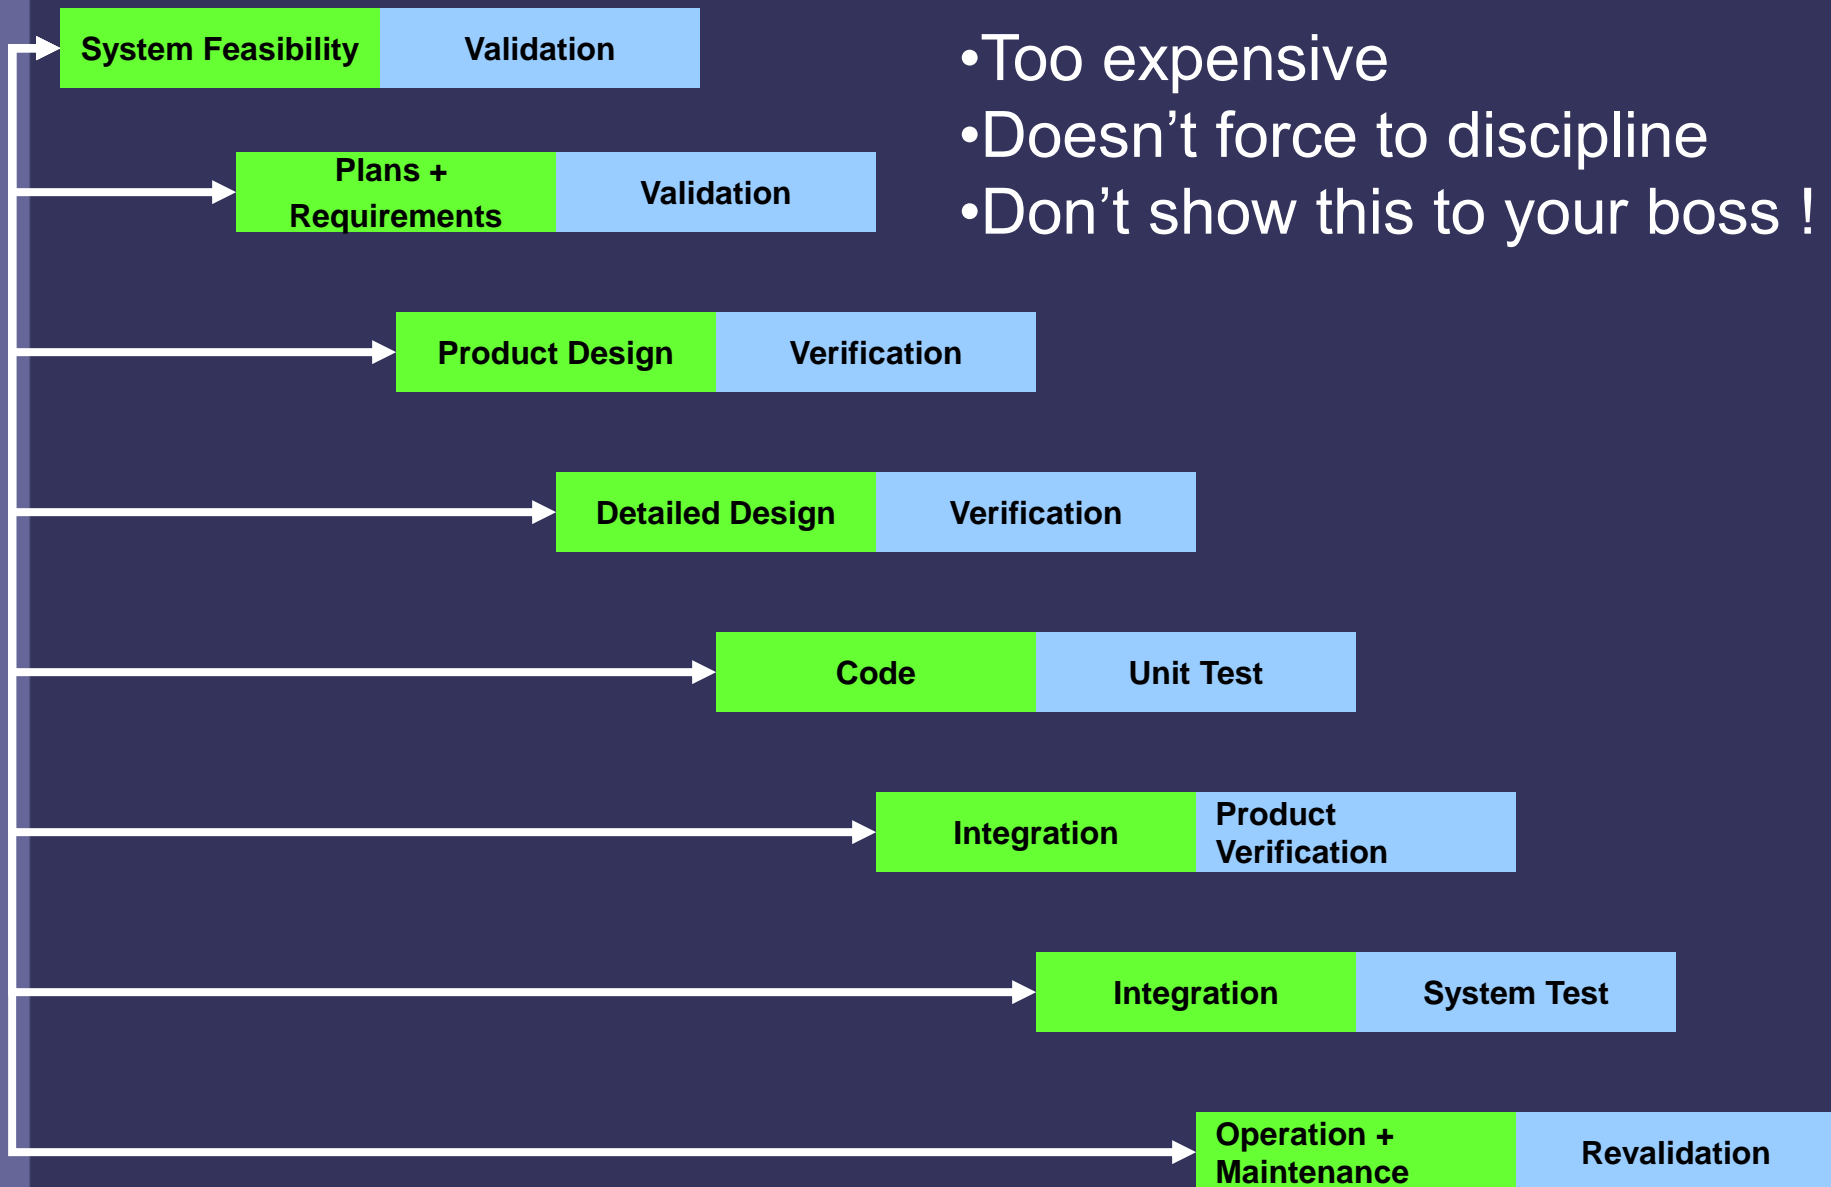

- Usually requirements change, are incomplete or even not known**
- Communication ! (...see Mars Orbiter...)**

**Result: 'That's not what I meant !' ( go back to last step )**

## **WF-Model reacts very statically:**

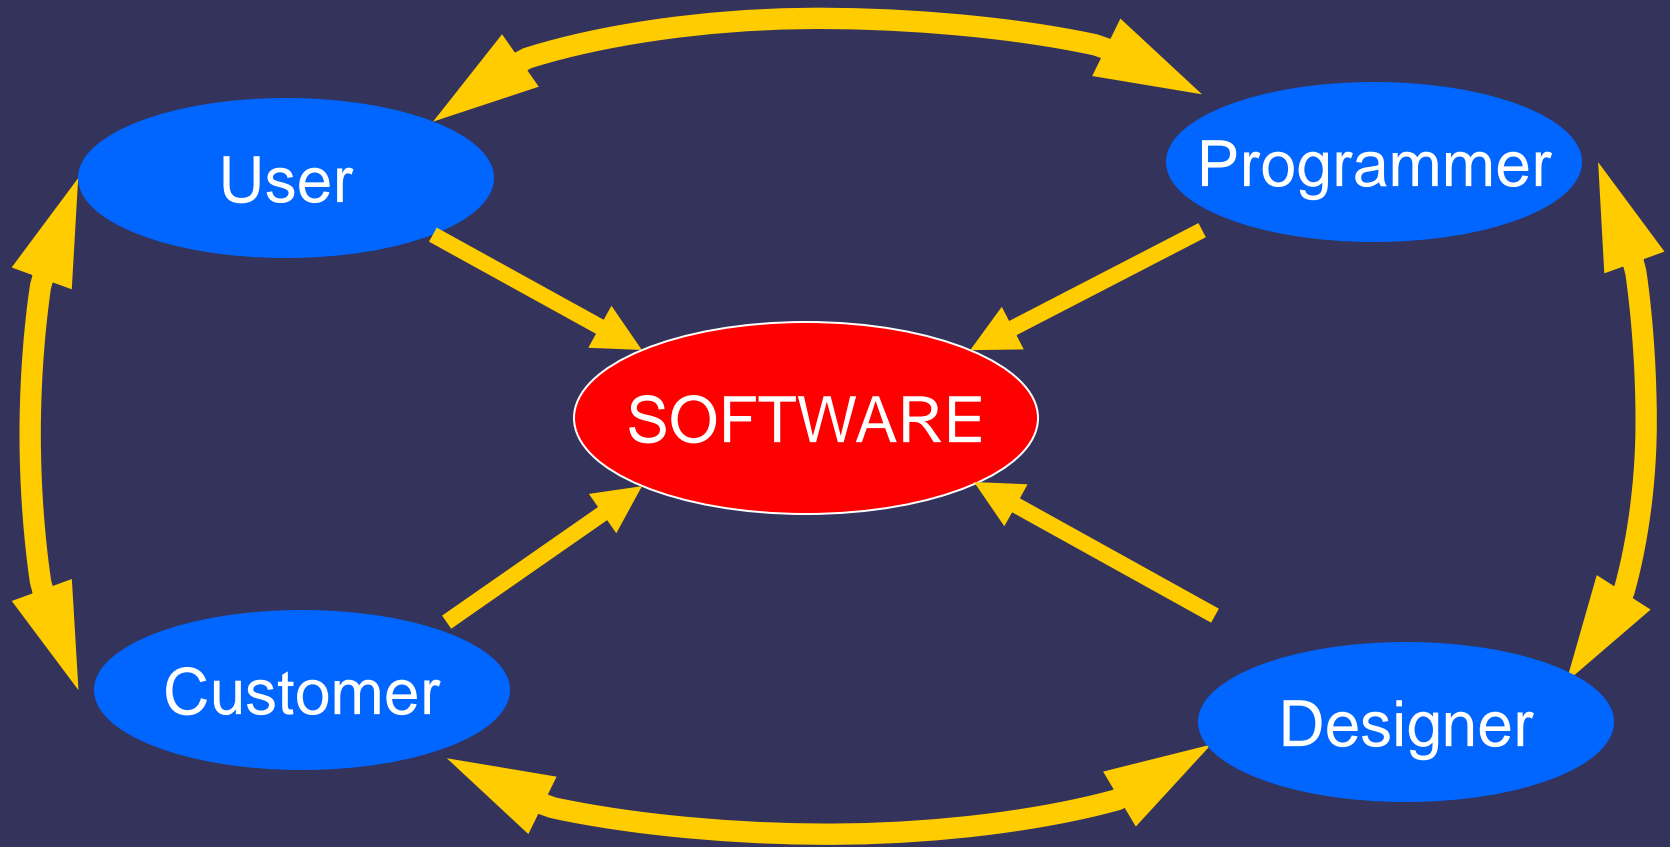

- Each stage must be completed before next one starts**

# Total Feedback

- Too expensive
- Doesn't force to discipline
- Don't show this to your boss !

# The Human Factor

Thanks to all
